**ABSTRACT:** In this paper, we prove some common fixed point theorem for weakly compatible maps in intuitionistic fuzzy metric space for two, four and six self mapping.

**KEYWORDS:** Intuitionistic fuzzy metric space, weakly compatible mappings.

### I. INTRODUCTION

The introduction of the concept of fuzzy sets by Zadeh [1] in 1965. Many authors have introduced the concept of fuzzy metric in different ways. Atanassov [2] introduced and studied the concept of intuitionistic fuzzy sets. In 1997 Coker [3] introduced the concept of intuitionistic fuzzy topological spaces. Park [20] defined the notion of intuitionistic fuzzy metric space with the help of continuous t-norm. Alaca et al. [4] using the idea of intuitionistic fuzzy sets, they defined the notion of intuitionistic fuzzy metric space. Turkoglu et al. [34] introduced the concept of compatible maps and compatible maps of types  $(\alpha)$  and  $(\beta)$  in intuitionistic fuzzy metric space and gave some relations between the concepts of compatible maps and compatible maps of types  $(\alpha)$  and  $(\beta)$ . Gregory et al. [12], Saadati et al [28], Singalotti et al [27], Sharma and Deshpande [30], Ciric et al [9], Jesic [13], Kutukcu [16] and many others studied the concept of intuitionistic fuzzy metric space and its applications. Sharma and Deshpandey [30] proved common fixed point theorems for finite number of mappings without continuity and compatibility on intuitionistic fuzzy metric spaces. R.P. Pant [23] has initiated work using the concept of R-weakly commuting mappings in 1994.

### II. PRELIMINARIES

We begin by briefly recalling some definitions and notions from fixed point theory literature that we will use in the sequel.

**Definition 2.1** [Schweizer et al. 1960] - A binary operation  $*$ :  $[0,1] \times [0,1] \rightarrow [0,1]$  is a continuous t-norms if  $*$  satisfying conditions:

- (i)  $*$  is commutative and associative;
- (ii)  $*$  is continuous;
- (iii)  $a * 1 = a$  for all  $a \in [0,1]$ ;
- (iv)  $a * b \leq c * d$  wherever  $a \leq c$  and  $b \leq d$  for all  $a, b, c, d \in [0,1]$ .

Example of t-norm are  $a * b = \min\{a, b\}$  and  $a * b = a \cdot b$ .

**Definition 2.2** [Schweizer et al. 1960] A binary operation  $\diamond$ :  $[0,1] \times [0,1] \rightarrow [0,1]$  is a continuous t-norms if  $\diamond$  satisfying conditions:

- (i)  $\diamond$  is commutative and associative;
- (ii)  $\diamond$  is continuous;
- (iii)  $a \diamond 0 = a$  for all  $a \in [0,1]$ ;
- (iv)  $a \diamond b \leq c \diamond d$  wherever  $a \leq c$  and  $b \leq d$  for all  $a, b, c, d \in [0,1]$ .

Example of t-norm are  $a \diamond b = \max\{a, b\}$  and  $a \diamond b = \min\{1, a + b\}$ .

**Definition 2.3** [Alaca, C. et. Al. 2006] A 5-tuple  $(X, M, N, *, \diamond)$  is said to be an intuitionistic fuzzy metric space if X is an arbitrary set,  $*$  is a continuous t-norm,  $\diamond$  is a continuous t-norm and  $M, N$  are fuzzy sets on  $X^2 \times (0, \infty)$  satisfying the following conditions:

- (i)  $M(x, y, t) + N(x, y, t) \leq 1$  for all  $x, y \in X$  and  $t > 0$ ;

- (ii)  $M(x, y, 0) = 0$  for all  $x, y \in X$  ;
- (iii)  $M(x, y, t) = 1$  for all  $x, y \in X$  and  $t > 0$  if and only if  $x = y$ ;
- (iv)  $M(x, y, t) = M(y, x, t)$  for all  $x, y \in X$  and  $t > 0$ ;
- (v)  $M(x, y, t) * M(y, z, s) \leq M(x, z, t + s)$  for all  $x, y, z \in X$  and  $s, t > 0$  ;
- (vi) For all  $x, y \in X, M(x, y, .): [0, \infty) \rightarrow [0, 1]$  is left continuous ;
- (vii)  $\lim_{t \rightarrow \infty} M(x, y, t) = 1$  for all  $x, y \in X$  and  $t > 0$ ;
- (viii)  $N(x, y, 0) = 1$  for all  $x, y \in X$ ;
- (ix)  $N(x, y, t) = 0$  for all  $x, y \in X$  and  $t > 0$ ; if and only if  $x = y$ .
- (x)  $N(x, y, t) = N(y, x, t)$  for all  $x, y \in X$  and  $t > 0$ ;
- (xi)  $N(x, y, t) \diamond N(y, z, s) \geq N(x, z, t + s)$  for all  $x, y, z \in X$  and  $s, t > 0$ ;
- (xii) for all  $x, y \in X, N(x, y, .): [0, \infty) \rightarrow [0, 1]$  is right continuous;
- (xiii)  $\lim_{t \rightarrow \infty} N(x, y, t) = 0$  for all  $x, y \in X$ ;

$(M, N)$  is called an intuitionistic fuzzy metric on  $X$  . The functions  $M(x, y, t)$  and  $N(x, y, t)$  denote the degree of nearness and the degree of non-nearness between  $x$  and  $y$  with respect to  $t$ , respectively.

**Remark 2.4** [Alaca, C. et. Al. 2006 ]. An intuitionistic fuzzy metric spaces with continuous t-norm  $*$  and Continuous t -conorm  $\diamond$  defined by  $a * a \geq a, a \in [0, 1]$  and  $(1 - a) \diamond (1 - a) \leq (1 - a)$  for all  $a \in [0, 1]$  , Then for all  $x, y \in X, M(x, y, *)$  is non-decreasing and,  $N(x, y, \diamond)$  is non-increasing.

**Remark 2.5**[Park, 2004]. Let  $(X, d)$  be a metric space .Define t-norm  $a * b = \min \{a, b\}$  and t-conorm  $a \diamond b = \max \{a, b\}$  and for all  $x, y \in X$  and  $t > 0$

$$M_d(x, y, t) = \frac{t}{t + d(x, y)}, N_d(x, y, t) = \frac{d(x, y)}{t + d(x, y)}$$

Then  $(X, M, N, *, \diamond)$  is an intuitionistic fuzzy metric space induced by the metric. It is obvious that  $N(x, y, t) = 1 - M(x, y, t)$ .

Alaca, Turkoglu and Yildiz [Alaca, C. et. Al. 2006] introduced the following notions:

**Definition 2.6.** Let  $(X, M, N, *, \diamond)$  be an intuitionistic fuzzy metric space. Then

- (i) a sequence  $\{x_n\}$  is said to be Cauchy sequence if, for all  $t > 0$  and  $p > 0$

$$\lim_{n \rightarrow \infty} M(x_{n+p}, x_n, t) = 1, N(x_{n+p}, x_n, t) = 0$$

- (ii) a sequence  $\{x_n\}$  in  $X$  is said to be convergent to a point  $x \in X$  if, for all  $t > 0$ .

$$\lim_{n \rightarrow \infty} M(x_n, x, t) = 1, N(x_n, x, t) = 0$$

Since  $*$  and  $\diamond$  are continuous, the limit is uniquely determined from (v) and (xi) of respectively.

**Definition 2.7.** An intuitionistic fuzzy metric space  $(X, M, N, *, \diamond)$  is said to be complete if and only if every Cauchy sequence in  $X$  is convergent.

**Definition 2.8.** A pair of self-mappings  $(f, g)$ , of an intuitionistic fuzzy metric space  $(X, M, N, *, \diamond)$  is said to be compatible if  $\lim_{n \rightarrow \infty} M(fg x_n, g f x_n, t) = 1$  and  $\lim_{n \rightarrow \infty} N(fg x_n, g f x_n, t) = 0$  for every  $t > 0$ , whenever  $\{x_n\}$  is a sequence in  $X$  such that  $\lim_{n \rightarrow \infty} f x_n = \lim_{n \rightarrow \infty} g x_n = z$  for some  $z \in X$ .

**Definition 2.9.** A pair of self-mappings  $(f, g)$ , of an intuitionistic fuzzy metric space  $(X, M, N, *, \diamond)$  is said to be non compatible if  $\lim_{n \rightarrow \infty} M(fg x_n, g f x_n, t) \neq 1$  or nonexistence and  $\lim_{n \rightarrow \infty} N(fg x_n, g f x_n, t) \neq 0$  or nonexistence for every  $t > 0$ ,

whenever  $\{x_n\}$  is a sequence in  $X$  such that  $\lim_{n \rightarrow \infty} f x_n = \lim_{n \rightarrow \infty} g x_n = z$  for some  $z \in X$ .

In 1998, Jungck and Rhoades [Jungck et. al. 1998] introduced the concept of weakly compatible maps as follows:

**Definition 2.10.** Two self maps  $f$  and  $g$  are said to be weakly compatible if they commute at coincidence points.

**Definition 2.11** [Alaca, C. et. Al. 2006 ]. Let  $(X, M, N, *, \diamond)$  be an intuitionistic fuzzy metric space then  $f, g : X \rightarrow X$  are said to be weakly compatible if they commute at coincidence points.

**Lemma 2.12**[ Alaca, C. et. Al. 2006]. Let  $(X, M, N, *, \diamond)$  be an intuitionistic fuzzy metric space and  $\{y_n\}$  be a sequence in X if there exist a number  $k \in (0, 1)$  such that,

- i)  $M(y_{n+2}, y_{n+1}, kt) \geq M(y_{n+1}, y_n, t)$
- ii)  $N(y_{n+2}, y_{n+1}, kt) \leq N(y_{n+1}, y_n, t)$

for all  $t > 0$  and  $n = 1, 2, 3 \dots \dots$  then  $\{y_n\}$  is a cauchy sequence in X.

**Lemma 2.13** Let  $(X, M, N, *, \diamond)$  be an IFM-space and for all  $x, y \in X, t > 0$  and if for a number  $k \in (0, 1)$  ,  $M(x, y, kt) \geq M(x, y, t), N(x, y, kt) \leq N(x, y, t)$  then  $x = y$ .

### III. MAIN RESULTS

**Theorem 3.1** – Let  $(X, M, N, *, \diamond)$  be an intuitionistic fuzzy metric space with continuous t-norm  $*$  and continuous t-norm  $\diamond$  defined by  $t * t \geq t$  and  $(1 - t) \diamond (1 - t) \leq (1 - t), \forall t \in [0, 1]$ . Let  $f$  and  $g$  be weakly compatible self mapping in X s.t.

a)  $g(X) \subseteq f(X)$

$$b) \begin{aligned} M(gx, gy, kt) &\geq \varphi \{M(fx, fy, t) * M(gx, fy, t) * M(fx, gx, t)\} \\ N(gx, gy, kt) &\leq \Psi \{N(fx, fy, t) \diamond N(gx, fy, t) \diamond N(fx, gx, t)\} \end{aligned}$$

Where ,  $0 < k < 1$  and  $\varphi, \Psi: [0, 1] \rightarrow [0, 1]$  is continuous function s.t.  $\varphi(s) > s$  and  $\Psi(s) < s$  ,for each  $0 < s < 1$  and  $\varphi(1) = 1, \Psi(0) = 0$  with  $M(x, y, t) > 0$ .

c) If one of  $g(X)$  or  $f(X)$  is complete

Then  $f$  and  $g$  have a unique common fixed point.

**Proof** – Let  $x_0 \in X$  be any arbitrary point. Since  $g(X) \subseteq f(X)$  ,choose  $x_1 \in X$

Such that  $y_{2n} = fx_{2n+1} = gx_{2n}$ .

Then by (b),

$$M(gx_{2n}, gx_{2n+1}, kt) \geq \varphi \left\{ \begin{aligned} &M(fx_{2n}, fx_{2n+1}, t) * M(gx_{2n}, fx_{2n+1}, t) \\ &* M(fx_{2n}, gx_{2n}, t) \end{aligned} \right\}$$

$$M(y_{2n}, y_{2n+1}, kt) \geq \varphi \left\{ \begin{aligned} &M(y_{2n-1}, y_{2n}, t) * M(y_{2n}, y_{2n}, t) \\ &* M(y_{2n-1}, y_{2n}, t) \end{aligned} \right\}$$

$$\begin{aligned} M(y_{2n}, y_{2n+1}, kt) &\geq \varphi \{M(y_{2n-1}, y_{2n}, t) * 1 * M(y_{2n-1}, y_{2n}, t)\} \\ M(y_{2n}, y_{2n+1}, kt) &\geq \varphi \{M(y_{2n-1}, y_{2n}, t)\} > M(y_{2n-1}, y_{2n}, t) \dots \dots \dots (1) \end{aligned}$$

As  $\varphi(s) > s$ , for each  $0 < s < 1$ .

and

$$N(gx_{2n}, gx_{2n+1}, kt) \leq \Psi \left\{ \begin{aligned} &N(fx_{2n}, fx_{2n+1}, t) \diamond N(gx_{2n}, fx_{2n+1}, t) \\ &\diamond N(fx_{2n}, gx_{2n}, t) \end{aligned} \right\}$$

$$N(y_{2n}, y_{2n+1}, kt) \leq \Psi \left\{ \begin{aligned} &N(y_{2n-1}, y_{2n}, t) \diamond N(y_{2n}, y_{2n}, t) \\ &\diamond N(y_{2n-1}, y_{2n}, t) \end{aligned} \right\}$$

$$N(y_{2n}, y_{2n+1}, kt) \leq \Psi \{N(y_{2n-1}, y_{2n}, t) \diamond 0 \diamond N(y_{2n-1}, y_{2n}, t)\}$$

$$N(y_{2n}, y_{2n+1}, kt) \leq \Psi \{N(y_{2n-1}, y_{2n}, t)\} < N(y_{2n-1}, y_{2n}, t)$$

As  $\Psi(s) < s$  for each  $0 < s < 1$ .

For all n,

$$M(y_{2n}, y_{2n+1}, kt) \geq M(y_{2n-1}, y_{2n}, t) \text{ and } N(y_{2n}, y_{2n+1}, kt) \leq N(y_{2n-1}, y_{2n}, t)$$

$$M(y_{2n+1}, y_{2n+2}, kt) \geq M(y_{2n+1}, y_{2n}, t) \text{ and } N(y_{2n+1}, y_{2n+2}, kt) \leq N(y_{2n+1}, y_{2n}, t),$$

Hence by lemma (2.12) ,  $\{y_{2n}\}$  is a Cauchy sequence in X. by completeness of X,  $\{y_{2n}\} = \{fx_{2n}\}$  is convergent, call  $z$  ,

Then  $\lim_{n \rightarrow \infty} fx_n = \lim_{n \rightarrow \infty} gx_n = z$

Now suppose  $f(X)$  is complete, so there exist a point  $p$  in X such that  $fp = z$

Now from (b),

$$M(gp, gx_n, kt) \geq \varphi\{M(fp, fx_n, t) * M(gp, fx_n, t) * M(fp, gp, t)\}$$

As  $n \rightarrow \infty$ ,

$$M(gp, z, kt) \geq \varphi\{M(z, z, t) * M(gp, z, t) * M(z, gp, t)\}$$

$$M(gp, z, kt) \geq \varphi\{1 * M(gp, z, t) * M(z, gp, t)\}$$

$$M(gp, z, kt) \geq \varphi\{M(gp, z, t)\} > M(gp, z, t) \dots\dots\dots(3)$$

And

$$N(gp, gx_n, kt) \leq \Psi\{N(fp, fx_n, t) \diamond N(gp, fx_n, t) \diamond N(fp, gp, t)\}$$

As  $n \rightarrow \infty$ ,

$$N(gp, z, kt) \leq \Psi\{N(z, z, t) \diamond N(gp, z, t) \diamond N(z, gp, t)\}$$

$$N(gp, z, kt) \leq \Psi\{0 \diamond N(gp, z, t) \diamond N(z, gp, t)\}$$

$$N(gp, z, kt) \leq \Psi\{N(gp, z, t)\} < N(gp, z, t) \dots\dots\dots(4)$$

From (3) and (4), we have

$$gp = z = fp$$

As  $f$  and  $g$  are weakly compatible, therefore  $fgp = gfp$ , i.e.  $fz = gz$

Now, we show that  $z$  is a fixed point of  $f$  and  $g$ . from (b),

$$M(gz, gx_n, kt) \geq \varphi\{M(fz, fx_n, t) * M(gz, fx_n, t) * M(fz, gz, t)\}$$

As  $n \rightarrow \infty$ ,

$$M(gz, z, kt) \geq \varphi\{M(gz, z, t) * M(gz, z, t) * M(gz, gz, t)\}$$

$$M(gz, z, kt) \geq \varphi\{M(gz, z, t) * M(gz, z, t) * 1\}$$

$$M(gz, z, kt) \geq \varphi\{M(gz, z, t)\} > M(gz, z, t) \dots\dots\dots(5)$$

and

$$N(gz, gx_n, kt) \leq \Psi\{N(fz, fx_n, t) \diamond N(gz, fx_n, t) \diamond N(fz, gz, t)\}$$

As  $n \rightarrow \infty$ ,

$$N(gz, z, kt) \leq \Psi\{N(gz, z, t) \diamond N(gz, z, t) \diamond N(gz, gz, t)\}$$

$$N(gz, z, kt) \leq \Psi\{N(gz, z, t) \diamond N(gz, z, t) \diamond 0\}$$

$$N(gz, z, kt) \leq \Psi\{N(gz, z, t)\} < N(gz, z, t) \dots\dots\dots(6)$$

From (5) and (6),

$$gz = z = fz$$

Hence  $z$  is common fixed point of  $f$  and  $g$ .

**Uniqueness** – Let  $w$  be another fixed point of  $f$  and  $g$ , then by (b),

$$M(gz, gw, kt) \geq \varphi\{M(fz, fw, t) * M(gz, fw, t) * M(fz, gz, t)\}$$

$$M(z, w, kt) \geq \varphi\{M(z, w, t) * M(z, w, t) * M(z, z, t)\}$$

$$M(z, w, kt) \geq \varphi\{M(z, w, t) * M(z, w, t) * 1\}$$

$$M(z, w, kt) \geq \varphi\{M(z, w, t)\} > M(z, w, t) \dots\dots\dots(7)$$

and

$$N(gz, gw, kt) \leq \Psi\{N(fz, fw, t) \diamond N(gz, fw, t) \diamond N(fz, gz, t)\}$$

$$N(z, w, kt) \leq \Psi\{N(z, w, t) \diamond N(z, w, t) \diamond N(z, z, t)\}$$

$$N(z, w, kt) \leq \Psi\{N(z, w, t) \diamond N(z, w, t) \diamond 0\}$$

$$N(z, w, kt) \leq \Psi\{N(z, w, t)\} < N(z, w, t) \dots\dots\dots(8)$$

From (7) and (8),

$$z = w$$

Therefore  $z$  is unique common fixed point of  $f$  and  $g$ .

**Theorem – 3.2** Let  $(X, M, N, *, \diamond)$  be an intuitionistic fuzzy metric space with continuous t-norm  $*$  and continuous t-norm  $\diamond$  defined by  $t * t \geq t$  and  $(1 - t) \diamond (1 - t) \leq (1 - t), \forall t \in [0, 1]$ . Let  $A, B, S$  and  $T$  be self mappings in  $X$  s.t.

a)  $A(X) \subseteq S(X)$  and  $B(X) \subseteq T(X)$ .

b) There exist a constant  $k \in (0, 1)$ , s.t.

$$M(Ax, By, kt) \geq \varphi\{M(Tx, Sy, t) * M(Tx, Ax, t) * M(Ax, Sy, t)\}$$

$$N(Ax, By, kt) \leq \Psi\{N(Tx, Sy, t) \diamond N(Tx, Ax, t) \diamond N(Ax, Sy, t)\}$$

$\forall x, y \in X$  and  $t > 0, 0 < k < 1$ , where  $\varphi, \Psi: [0,1] \rightarrow [0,1]$  is continuous function s.t.  $\varphi(s) > s$  and  $\Psi(s) < s$ , for each  $0 < s < 1$  and  $\varphi(1) = 1, \Psi(0) = 0$  with  $M(x, y, t) > 0$ .

c) If one of the  $A(X), B(X), S(X)$  and  $T(X)$  is complete subspace of  $X$ ,

Then  $\{A, T\}$  and  $\{B, S\}$  have a coincidence point

More over ,if the pair  $\{A, T\}$  and  $\{B, S\}$  are weakly compatible ,then A, B, S and T have a unique common fixed point.

**Proof** – Let  $x_0$  be any arbitrary point since  $A(X) \subseteq S(X)$  , there is a point  $x_1 \in X$  s. t.

$Ax_0 = Sx_1$  . Again since  $B(X) \subseteq T(X)$  for this  $x_2 \in X$  s. t.  $Bx_1 = Tx_2$  and so on. Then we get a sequence  $\{y_n\}$  s.t.  $y_{2n} = Ax_{2n} = Sx_{2n-1}$  and  $y_{2n+1} = Bx_{2n+1} = Tx_{2n+2}, n = 0,1,2 \dots \dots$

Putting  $x = x_{2n}, y = x_{2n+1}$  in (b) we have,

$$\begin{aligned} M(Ax_{2n}, Bx_{2n+1}, kt) &\geq \varphi\{M(Tx_{2n}, Sx_{2n+1}, t) * M(Tx_{2n}, Ax_{2n}, t) * M(Ax_{2n}, Sx_{2n+1}, t)\} \\ M(y_{2n}, y_{2n+1}, kt) &\geq \varphi\{M(y_{2n-1}, y_{2n}, t) * M(y_{2n-1}, y_{2n}, t) * M(y_{2n}, y_{2n}, t)\} \\ M(y_{2n}, y_{2n+1}, kt) &\geq \varphi\{M(y_{2n-1}, y_{2n}, t) * 1\} \\ &\geq \varphi\{M(y_{2n-1}, y_{2n}, t)\} > M(y_{2n-1}, y_{2n}, t) \end{aligned}$$

As  $\varphi(s) > s$  for each  $0 < s < 1$ .

and

$$\begin{aligned} N(Ax_{2n}, Bx_{2n+1}, kt) &\leq \Psi\{N(Tx_{2n}, Sx_{2n+1}, t) \diamond N(Tx_{2n}, Ax_{2n}, t) \diamond N(Ax_{2n}, Sx_{2n+1}, t)\} \\ N(Ax_{2n}, Bx_{2n+1}, kt) &\leq \Psi\{N(y_{2n-1}, y_{2n}, t) \diamond N(y_{2n-1}, y_{2n}, t) \diamond N(y_{2n}, y_{2n}, t)\} \\ N(y_{2n}, y_{2n+1}, kt) &\leq \Psi\{N(y_{2n-1}, y_{2n}, t) \diamond 0\} \\ &\leq \Psi\{N(y_{2n-1}, y_{2n}, t)\} < N(y_{2n-1}, y_{2n}, t) \end{aligned}$$

As  $\Psi(s) < s$  for each  $0 < s < 1$ .

For all  $n$ ,

$$\begin{aligned} M(y_{2n}, y_{2n+1}, kt) &\geq M(y_{2n-1}, y_{2n}, t) \text{ and } N(y_{2n}, y_{2n+1}, kt) \leq N(y_{2n-1}, y_{2n}, t) \\ M(y_{2n+1}, y_{2n+2}, kt) &\geq M(y_{2n+1}, y_{2n}, t) \text{ and } N(y_{2n}, y_{2n+1}, kt) \leq N(y_{2n-1}, y_{2n}, t) \end{aligned}$$

Hence by lemma (2.12) ,  $\{y_n\}$  is a Cauchy sequence in  $X$ .

Now suppose  $S(X)$  is a complete subspace of  $X$ .note that the sequence  $\{y_{2n}\}$  is contained in  $S(X)$  and has a limit in  $S(X)$  say  $u$ . so we get  $Sw = u$ . we shall use the fact that subsequence  $\{y_{2n+1}\}$  also convergence to  $u$  .

now putting  $x = x_{2n}, y = w$  in (b)

and taking  $n \rightarrow \infty$

$$\begin{aligned} M(Ax_{2n}, Bw, kt) &\geq \varphi\{M(Tx_{2n}, Sw, t) * M(Tx_{2n}, Ax_{2n}, t) * M(Ax_{2n}, Sw, t)\} \\ M(u, Bw, kt) &\geq \varphi\{M(u, u, t) * M(u, u, t) * M(u, u, t)\} \\ &= \varphi(1) = 1 \end{aligned}$$

$$\text{i. e } M(u, Bw, kt) \geq 1 \dots \dots \dots (3)$$

Also,

$$\begin{aligned} N(Ax_{2n}, Bw, kt) &\leq \Psi\{N(Tx_{2n}, Sw, t) \diamond N(Tx_{2n}, Ax_{2n}, t) \diamond N(Ax_{2n}, Sw, t)\} \\ N(u, Bw, kt) &\leq \Psi\{N(u, u, t) \diamond N(u, u, t) \diamond N(u, u, t)\} \\ &= \Psi(0) = 0 \end{aligned}$$

$$\text{i.e, } N(u, Bw, kt) \leq 0 \dots \dots \dots (4)$$

from (3) and (4),  $u = Bw$ .

Since  $Sw = Bw = u$ , i. e  $w$  is the coincidence point of  $B$  and  $S$ .

As  $B(X) \subseteq T(X), u = Bw \Rightarrow u \in T(X)$ .let  $v \in T^{-1}u$  then  $Tv = u$

By putting  $x = v, y = x_{2n+1}$  in (b),we get,

$$M(Av, Bx_{2n+1}, kt) \geq \varphi\{M(Tv, Sx_{2n+1}, t) * M(Tv, Av, t) * M(Av, Sx_{2n+1}, t)\}$$

As  $n \rightarrow \infty$

$$\begin{aligned} M(Av, u, kt) &\geq \varphi\{M(u, u, t) * M(u, Av, t) * M(Av, u, t)\} \\ M(Av, u, kt) &\geq \varphi\{M(u, Av, t) * 1\} = \varphi\{M(u, Av, t)\} > \{M(u, Av, t)\} \dots \dots \dots (5) \end{aligned}$$

and

$$N(Av, Bx_{2n+1}, kt) \leq \Psi\{N(Tv, Sx_{2n+1}, t) \diamond N(Tv, Av, t) \diamond N(Av, Sx_{2n+1}, t)\}$$

As  $n \rightarrow \infty$

$$N(Av, u, kt) \leq \Psi\{N(u, u, t) \diamond N(u, Av, t) \diamond N(Av, u, t)\}$$

$$N(Av, u, kt) \leq \Psi\{N(u, Av, t) \diamond 0\} = \Psi\{N(u, Av, t)\} < N(u, Av, t) \quad \dots\dots\dots(6)$$

From (5) and (6), we get,

$$Av = u$$

Since  $Tv = u$ , we have  $Av = Tv = u$ . thus  $v$  is the coincidence point of  $A$  and  $T$ . If one assume  $T(X)$  to be complete, then an analogous argument establish this claim.

The remaining two cases pertain essentially to the previous cases. Indeed if  $B(X)$  is complete then  $u \in B(X) \subset T(X)$  and if  $A(X)$  is complete then  $u \in A(X) \subset S(X)$ . Thus (c) is completely established.

Since the pair  $\{A, T\}$  and  $\{B, S\}$  are weakly compatible, i.e.

$$B(Sw) = S(Bw) \Rightarrow Bu = Su \text{ and } A(Tv) = T(Av) \Rightarrow Au = Tu.$$

Putting  $x = u, y = x_{2n+1}$  in (b), we get

$$M(Au, Bx_{2n+1}, kt) \geq \varphi\{M(Tu, Sx_{2n+1}, t) * M(Tu, Au, t) * M(Au, Sx_{2n+1}, t)\}$$

As  $n \rightarrow \infty$

$$M(Au, u, kt) \geq \varphi\{M(Au, u, t) * M(Au, Au, t) * M(Au, u, t)\} \\ M(Au, u, kt) \geq \varphi\{M(Au, u, t)\} > M(Au, u, t) \quad \dots\dots\dots(7)$$

and

$$N(Au, Bx_{2n+1}, kt) \leq \Psi\{N(Tu, Sx_{2n+1}, t) \diamond N(Tu, Au, t) \diamond N(Au, Sx_{2n+1}, t)\}$$

As  $n \rightarrow \infty$

$$N(Au, u, kt) \leq \Psi\{N(Au, u, t) \diamond N(Au, Au, t) \diamond N(Au, u, t)\} \\ N(Au, u, kt) \leq \Psi\{N(Au, u, t)\} < N(Au, u, t) \quad \dots\dots\dots(8)$$

From (7) and (8), implies that  $Au = u \Rightarrow Au = Tu = u$

Similarly by putting  $x = x_{2n}, y = u$  in (b) and as  $n \rightarrow \infty$

We have  $u = Bu = Su$ . thus  $Au = Su = Tu = u$ .

i.e  $u$  is a common fixed point of  $A, B, S$  and  $T$ .

**Uniqueness-** let  $w (w \neq u)$  be another common fixed point of  $A, B, S$  and  $T$ .

Then by putting  $x = u, y = w$  in (b)

$$M(Au, Bw, kt) \geq \varphi\{M(Tu, Sw, t) * M(Tu, Au, t) * M(Au, Sw, t)\}$$

$$M(u, w, kt) \geq \varphi\{M(u, w, t) * M(u, u, t) * M(u, w, t)\} \\ M(u, w, kt) \geq \varphi\{M(u, w, t) * 1\} > M(u, w, t) \quad \dots\dots\dots(9)$$

and

$$N(Au, Bw, kt) \leq \Psi\{N(Tu, Sw, t) \diamond N(Tu, Au, t) \diamond N(Au, Sw, t)\} \\ N(u, w, kt) \leq \Psi\{N(u, w, t) \diamond N(u, u, t) \diamond N(u, w, t)\} \\ N(u, w, kt) \leq \Psi\{N(u, w, t) \diamond 0\} < N(u, w, t) \quad \dots\dots\dots(10)$$

From (9) and (10)

$$u = w \text{ for all } x, y \in X \text{ and } t > 0.$$

Therefore  $u$  is the unique common fixed point of  $A, B, S$  and  $T$ .

**Theorem – 3.3** Let  $(X, M, N, *, \diamond)$  be an intuitionistic fuzzy metric space with continuous t-norm  $*$  and continuous t-norm  $\diamond$  defined by  $t * t \geq t$  and  $(1 - t) \diamond (1 - t) \leq (1 - t)$ ,

$\forall t \in [0, 1]$ . Let  $A, B, S$  and  $T$  be self mappings in  $X$  s.t.

a)  $P(X) \subseteq ST(X)$  and  $Q(X) \subseteq AB(X)$

b) There exist a constant  $k \in (0, 1)$  s. t.

$$M(Px, Qy, kt) \geq \varphi\{M(Px, ABx, t) * M(STy, ABx, t) * (Px, STy, t)\}$$

and

$$N(Px, Qy, kt) \leq \Psi\{N(Px, ABx, t) \diamond N(STy, ABx, t) \diamond N(Px, STy, t)\}$$

$\forall x, y \in X$  and  $t > 0$  where  $\varphi, \Psi: [0, 1] \rightarrow [0, 1]$  is continuous function s.t.

$$\varphi(s) > s \text{ and } \Psi(s) < s, \text{ for each } 0 < s < 1 \text{ and } \varphi(1) = 1,$$

$$\Psi(0) = 0 \text{ with } M(x, y, t) > 0.$$

(c) If one of the  $P(X), Q(X), ST(X)$ , and  $AB(X)$  is a complete subspace of  $X$  then

$\{AB, P\}$  and  $\{Q, ST\}$  have a coincidence point.

(d)  $AB = BA, ST = TS, PB = BP$  and  $QT = TQ$

Moreover if the pair  $\{AB, P\}$  and  $\{Q, ST\}$  are weakly compatible ,then  $A, B, S, T, P,$  and  $Q$  have a unique common fixed point.

**Proof** – Let  $x_0 \in X$  be an arbitrary point. since  $P(X) \subseteq ST(X)$ , there exist  $x_1 \in X$  s.t.  $Px_0 = STx_1 = y_0$ . again since  $Q(X) \subseteq AB(X)$  for this  $x_1$  there is  $x_2 \in X$  s.t.

$Qx_1 = ABx_2 = y_1$  and so on. Inductively we get a sequence  $\{x_n\}$  and  $\{y_n\}$  in  $X$  s.t.

$y_{2n} = Px_{2n} = STx_{2n+1}$  and  $y_{2n+1} = Qx_{2n+1} = ABx_{2n+2}, n = 0,1,2 \dots \dots$

Putting  $x = x_{2n}, y = x_{2n+1}$  in (b) we have,

$$\begin{aligned} M(Px_{2n}, Qx_{2n+1}, kt) &\geq \varphi\{M(Px_{2n}, ABx_{2n}, t) * M(STx_{2n+1}, ABx_{2n}, t) * (Px_{2n}, STx_{2n+1}, t)\} \\ M(y_{2n}, y_{2n+1}, kt) &\geq \varphi\{M(y_{2n}, y_{2n-1}, t) * M(y_{2n}, y_{2n-1}, t) * M(y_{2n}, y_{2n}, t)\} \\ M(y_{2n}, y_{2n+1}, kt) &\geq \varphi\{M(y_{2n}, y_{2n-1}, t) * 1\} > M(y_{2n}, y_{2n-1}, t) \dots\dots\dots(1) \end{aligned}$$

and

$$\begin{aligned} N(Px_{2n}, Qx_{2n+1}, kt) &\leq \Psi\{N(Px_{2n}, ABx_{2n}, t) \diamond N(STx_{2n+1}, ABx_{2n}, t) \diamond N(Px_{2n}, STx_{2n+1}, t)\} \\ N(y_{2n}, y_{2n+1}, kt) &\leq \Psi\{N(y_{2n}, y_{2n-1}, t) \diamond N(y_{2n}, y_{2n-1}, t) \diamond N(y_{2n}, y_{2n}, t)\} \\ N(y_{2n}, y_{2n+1}, kt) &\leq \Psi\{N(y_{2n}, y_{2n-1}, t) \diamond N(y_{2n}, y_{2n-1}, t) \diamond N(y_{2n}, y_{2n}, t)\} \\ N(y_{2n}, y_{2n+1}, kt) &\leq \Psi\{N(y_{2n}, y_{2n-1}, t) \diamond 0\} < N(y_{2n}, y_{2n-1}, t) \dots\dots\dots(2) \end{aligned}$$

Hence we have from (1) and (2)

$$M(y_{2n}, y_{2n+1}, kt) \geq M(y_{2n}, y_{2n-1}, t) \text{ and } N(y_{2n}, y_{2n+1}, kt) \leq N(y_{2n}, y_{2n-1}, t).$$

Similarly we also have

$$M(y_{2n+1}, y_{2n+2}, kt) \geq M(y_{2n+1}, y_{2n}, t) \text{ and } N(y_{2n+1}, y_{2n+2}, kt) \leq N(y_{2n+1}, y_{2n}, t).$$

$$M(y_{2n}, y_{2n+1}, kt) \geq M(y_{2n-1}, y_{2n}, t) \text{ and } N(y_{2n}, y_{2n+1}, kt) \leq N(y_{2n+1}, y_{2n}, t),$$

Hence by lemma (2.12),  $\{y_n\}$  is a Cauchy sequence in  $X$ .

Now suppose  $AB(X)$  is a complete subspace of  $X$ .note that the sequence  $\{y_{2n+1}\}$  is contained in  $AB(X)$  and has a limit in  $AB(X)$  say  $z$ . so we get  $ABw = z$ . we shall use the fact that subsequence  $\{y_{2n}\}$  also convergence to  $z$ . now putting  $x = w, y = x_{2n+1}$  in (b)

and taking  $n \rightarrow \infty$ , we have

$$M(Pw, Qx_{2n+1}, kt) \geq \varphi\{M(Pw, ABw, t) * M(STx_{2n+1}, ABw, t) * (Pw, STx_{2n+1}, t)\}$$

As  $n \rightarrow \infty$

$$M(Pw, z, kt) \geq \varphi\{M(Pw, z, t) * M(z, z, t) * (Pw, z, t)\}$$

$$M(Pw, z, kt) \geq \varphi\{M(Pw, z, t) * 1\} > M(Pw, z, t) \dots\dots\dots(3)$$

and

$$N(Pw, Qx_{2n+1}, kt) \leq \Psi\{N(Pw, ABw, t) \diamond N(STx_{2n+1}, ABw, t) \diamond N(Pw, STx_{2n+1}, t)\}$$

As  $n \rightarrow \infty$

$$N(Pw, z, kt) \leq \Psi\{N(Pw, z, t) \diamond N(z, z, t) \diamond N(Pw, z, t)\}$$

$$N(Pw, z, kt) \leq \Psi\{N(Pw, z, t) \diamond 0\} < N(Pw, z, t) \dots\dots\dots(4)$$

From (3) and (4),  $Pw = z$ . Since  $ABw = z$  thus we have  $Pw = z = ABw$  that is  $w$  is coincidence point of  $P$  and  $AB$ . Since  $P(X) \subset ST(X), Pw = z$  implies that  $z \in ST(X)$ .

let  $v \in ST^{-1}z$ , then  $STv = z$ .

Putting  $x = x_{2n}$  and  $y = v$  in (b), we have

$$M(Px_{2n}, Qv, kt) \geq \varphi\{M(Px_{2n}, ABx_{2n}, t) * M(STv, ABx_{2n}, t) * (Px_{2n}, STv, t)\}$$

As  $n \rightarrow \infty$

$$M(z, Qv, kt) \geq \varphi\{M(z, z, t) * M(z, z, t) * (z, z, t)\}$$

$$M(z, Qv, kt) \geq \varphi\{1\} = 1$$

$$M(z, Qv, kt) \geq 1 \dots\dots\dots(5)$$

and

$$N(Px_{2n}, Qv, kt) \leq \Psi\{N(Px_{2n}, ABx_{2n}, t) \diamond N(STv, ABx_{2n}, t) \diamond N(Px_{2n}, STv, t)\}$$

$$N(z, Qv, kt) \leq \Psi\{N(z, z, t) \diamond N(z, z, t) \diamond N(z, z, t)\}$$

$$N(z, Qv, kt) \leq \Psi\{0\} = 0$$

$$N(z, Qv, kt) \leq 0 \dots\dots\dots(6)$$

From (5) and (6), we have  $z = Qv$ .

Again Putting  $x = z$  and  $y = x_{2n+1}$  in (b) and as  $n \rightarrow \infty$

$$M(Pz, Qx_{2n+1}, kt) \geq \varphi\{M(Pz, ABz, t) * M(STx_{2n+1}, ABz, t) * (Pz, STx_{2n+1}, t)\}$$

$$M(Pz, z, kt) \geq \varphi\{M(Pz, Pz, t) * M(z, Pz, t) * (Pz, z, t)\}$$

$$M(Pz, z, kt) \geq \varphi\{M(Pz, z, t) * 1\} > M(Pz, z, t) \dots\dots\dots(7)$$

and

$$N(Pz, Qx_{2n+1}, kt) \leq \Psi\{N(Pz, ABz, t) \diamond N(STx_{2n+1}, ABz, t) \diamond N(Pz, STx_{2n+1}, t)\}$$

$$N(Pz, z, kt) \leq \Psi\{N(Pz, Pz, t) \diamond N(z, Pz, t) \diamond N(Pz, z, t)\}$$

$$N(Pz, z, kt) \leq \Psi\{N(Pz, z, t) \diamond 0\} < N(Pz, z, t) \dots\dots\dots(8)$$

From (7) and (8),  $Pz = z$ . So  $Pz = ABz = z$ .

By putting  $x = x_{2n}, y = z$  in (b) and taking  $n \rightarrow \infty$ ,  $Qz = z$ . hence  $Qz = STz = z$ .

Now putting  $x = z, y = Tz$  in (b) and using (d), we have

$$M(z, Tz, kt) \geq 1 \text{ and } N(z, Tz, kt) \leq 0. \text{ thus } z = Tz.$$

Since  $STz = z$ , therefore  $Sz = z$ .

To prove,  $Bz = z$ , we put  $x = Bz, y = z$  in (b) and using (d),

We have  $M(z, Bz, kt) \geq 1$  and  $N(z, Bz, kt) \leq 0$ . Thus  $z = Bz$ .

Since  $ABz = z$  therefore  $Az = z$ .

By combining the above result we have  $Az = Bz = Sz = Tz = Pz = Qz = z$ .

that is  $z$  is a common fixed point of  $A, B, S, T, P$  and  $Q$ .

**Uniqueness** – Let  $w (w \neq z)$  be another common fixed point of  $A, B, S, T, P$  and  $Q$  then  $Aw = Bw = Sw = Tw = Pw = Qw = w$ .

By putting  $x = z, y = w$ , we have  $M(z, w, kt) \geq 1$  and  $N(z, w, kt) \leq 0$ .

Hence  $z = w$  for all  $x, y \in X$  and  $t > 0$ .

Therefore  $z$  is the unique common fixed point of  $A, B, S, T, P$  and  $Q$ .
